TITLE: Stripping Work at the Sokolovskoye Opencast Iron Ore Mine (Vskryshnyye raboty na Sokolovskom zheleznorudnom kar'yere)

PERIODICAL: Gornyy zhurnal, 1958, Nr 11, pp 16 - 21 (USSR)

ABSTRACT: The timely execution of stripping works and the preparation of a normal working surface for opencast mining in the Sokolovskoye-Sarbay trust were the most important factors in starting the production of iron ore in the quantities foreseen by the plan (Sokolovskoye deposits - 5,000,000 tons and the Sarbay deposit - 10,000,000 tons a year). By 1 January 1958, 17,000,000 tons out of the 28,000,000 tons of overburden were removed at the Sokolovskoye deposit. The daily volume of stripping operations gradually increased from 12,000 cubic m in 1956 to 50,000 cubic m at the end of 1957. This increase was the result of the utilization of new transportation machines and of an improved organization of work at the mine. Roads for trucks and railways were built. The authors describe in detail different types of excavators,

Card 1/2

SOV/127-58-11-4/16
Stripping Works at the Sokolovskoye Opencast Iron Ore Mine

bulldozers and trucks used, as well as the organization of working brigades. During the first 6 months of 1958, a total of 425,963 tons of iron ore was produced at the Sokolovskoye deposit. There are 6 tables, 1 photo and 2 Soviet references.

Title : Characteristics of Coronabacterium Nipaherise
strains isolated during the 1955-6 epidemic in
the City of Lodz.

Orig Pub: Przegl. epidemiol., 1957, 11, No 4, 371-383.

Abstract: The properties of 276 diphtheria strains iso-
lated from 250 patients in the city of Lodz,
which the author considers an endemic center
of diphtheria, were studied. Of all strains,
33.4% were of the gravis type; 26.2% were of

Card 1/3

56

Abstract: The "incomplete" gravis type, differing from the
classical (serotype Melod) type, in the type of the
1.9% belonged to the mitis type. The type of the
intermediate type; in 17.2% of strains, the type
was not established. The Zurekowsky study of
1956 showed considerable predominance of the
mitis type. Of 169 strains isolated from pati-
ents in 1952, Swiatkowski found 83.5% gravis type;
10.5% "incomplete" gravis type; 10.5% mitis type.
During the evolution and distribution of diph-
theria, the gravis type occurred in Lodz with the prop-
erly named strains. The gravis type (mitis-
intermediate-gravis) was found in the mitis-
era earlier than the gravis type. The prevalence of the
gravis type in the Lodz area at present; the

Card 2/3

Abstract: Predominance of the "incomplete" or "atypical"
gravis (serotype Melod) type is beginning as
a transitional stage toward the mitis type.
Evolution of strains can, to a certain degree,
depend on immunization of the population, lead-
ing to survival of more virulent strains, which
most commonly belong to the gravis type. --

Title: Effect of Metals on Lacquer Formation Properties of Oils

Original

Publication: Khimiya i tekhnol. topliva, 1956, No 5, 64-69

Abstract:

Formation of lacquer in a thin layer (150 μ) of oils MK-22, MS-20, Avtol-10 and paraffin-naphthenic fraction of MS-20 oil, on steel 20, stainless steel, duraluminum, aluminum, bronze and copper, was studied by the method of GOST 5737-53 in the range of 250-300°, with a duration of heating of the oil of 30 minutes. It was found that the catalytic action of metals on the process of lacquer formation depends on the chemical composition and volatility of the oil and on the temperature. In the case of MK-22 and MS-20 oil and the paraffin-naphthenic

Abst Journal: Referat Zhur - Khimiya, No 2, 1957, 5560

Abstract: fraction of MS-20 oil the strongest catalyst is steel 20, while for Avtol-10 it is copper and bronze. With increase in volatility of the oil the catalytic action of metals on the process of lacquer formation decreases. The greatest difference in catalytic action of metals on lacquer formation is observed at 250-280°.

Title: Critical Temperature of Lacquer Formation

Original

Publication: Khimiya i tekhnol. topliva, 1956, No 3, 70-72

Abstract: An investigation, by the method of GOST 5737-53, of dependence of lacquer formation, in a thin layer, on heating temperature (in the range 220-280°), of various oils, as such and with additives. It is shown that at a definite temperature, that is critical for each specific oil, intensive lacquer formation sets in. According to the critical temperature of lacquer formation a comparison was made of the effectiveness of various additives for commercial oils. Of the investigated additives the most effective was found to be ZIT-2, which on addition in an amount of 1.5% raises the critical temperature from 235-245° to 275-280°.

TITLE:

Effect of Esters of Unsaturated Phosphinous Acids on the Antioxidation Properties of Mineral Oil (Vliyaniye efirov nepredel'nykh fosfinovykh kislot na antioksiditel'nyye svoystva mineral'nogo masla)

PERIODICAL:

Zhurnal prikladnoy khimii, 1959, Nr 1, pp 180-186 (USSR)

ABSTRACT:

Phosphorus-organic compounds improve the properties of lubricating oils. In the present paper the authors describe the effect of esters of unsaturated phosphinous acids on the antioxidizing properties of the MS-2C mineral oil. The evaluation of these properties was performed by the four methods: 1. thermal oxidizing stability, 2. volatility, 3. working fraction and 4. varnish formation (GOST 5737-53), and the results were compiled into tables. Their analysis leads to the following conclusions: 1. The antioxidizing properties of unsaturated phosphinous acid esters are improved: a. with the introduction of the phenyl group in diethyl, diallyl and dihexyl esters; b. with the presence of the indenyl group in diethyl and diallyl esters; c. with an increase in the length of the hydrocarbon radical (from C₂ to C₆) in diallyl and dihexyl esters; d. with an increase in the length of the chain of the ester grouping radical (from C₂ to C₆) in esters of the β -butoxivinyl-

TITLE: Effect of Tetraalkyldiamides and Dipiperidides of Unsaturated Phosphine Acids on the Antioxidation Properties of Mineral Oil (Vliyaniye tetraalkildiamidov i dipiperididov na oksidatsionnykh fosfinovykh kislot na antiokislitel'nyye svoystva mineral'nogo masla)

PERIODICAL: Zhurnal prikladnoy khimii, 1959, Vol XXXII, Nr 2, pp 358-363 (USSR)

ABSTRACT: The effect of diamides and dipiperidides of unsaturated phosphinic acids on the antioxidizing properties of the oil MS-20 is investigated here. The dipiperidide radical in the compounds increases their anticidizing property. Phenyl and phenoxy groups increase the antioxidation properties only in tetraethyldiamides, but not in other compounds. The lengthening of the carbon radical in the group $(NR_2)_2$ from C_2 to C_4 reduces anti-oxidation in tetraethyldiamides and tetrabutylidiamides. Tetraalkyldiamides and piperidides of unsaturated phosphinic acids

TITLE:

The Effect of Thio-Compounds of Unsaturated Phosphinic Acids on the Anti-Oxidation Properties of Mineral Oil (Vzdeystvie tiiosoyedineniy neprudel'nykh fosfinovykh kislot na antiokislitel'nyye svoystva mineral'nogo masla)

PERIODICAL:

Zhurnal prikladnoy khimii, 1959, Vol. XXXII, Nr 3, pp 656-659 (USSR)

ABSTRACT:

The effect of the dithioethyl ethers of unsaturated phosphinic and thiophosphinic acids and of the ethers of alkylthiovinylphosphinic acids on the antioxidation properties of the oil MS-20 is investigated here. The best result is obtained with the dithioethyl ether of the β -ethoxyethoxyvinylphosphinic acid. The introduction of sulfur into the ethers of unsaturated phosphinic acids increases their antioxidation properties strongly. The ethers of alkylthiovinylphosphinic acids have no effect on the stability against thermal oxidation.

TITLE:

Method for the Classification of the Volatility of Plastic Lubricants

PERIODICAL:

Zavodskaya laboratoriya, 1959, Vol 25, Nr 11, pp 1349-1351 (USSR)

ABSTRACT:

A number of methods of lubricant quality control used at present possess a low reproducibility. An accelerated method based on the measurement of the loss in weight of a lubricant sample has been developed. The latter is applied to a standard vaporizer (diameter 21.4 mm) (GOST 5737-53) in a layer of 1 mm thickness and kept for 1-3 hours in a special thermostat at a certain temperature. A thermostat with film formation as it is normally used for the volatility determination of oils was used (Ref 1). Vaporizers with ring-shaped shelves (Fig 1) were used besides standard vaporizers. The TsIATIM-201 lubricant was tested and it was found that the weighed portions are different in the case of different vaporizers, which is also reflected in the volatility measurements (Fig 2). A satisfactory reproducibility of the measurement results is achieved with weighed portions of the

Card 1/2

Method for the Classification of the
Volatility of Plastic Lubricants

BOV/32-25-11-34/69

lubricant of 0.3 - 0.32 g only. It was observed that the location of the vaporizers in the thermostat does not affect the measurement results (Fig 3). Volatility determinations of the MVP and MK-8 lubricants, thickened in one case by means of aluminum stearate (sample liquid) and in the other case with lithium stearate (sample plastic) gave different measurement results under the same conditions. The duration of the test is reduced by increasing the test temperature (Table 1, lubricants of types OKB-122-7-5, OKB-122-5a, TsIATIM-201, and 2TsKPa), which, however, must not exceed the melting point of the thickening substance. A certain working technique, which yielded well reproducible determination results, is recommended (Table 2, results for lubricants of types TsIATIM-201, GSA, OKB-122-7). There are 3 figures, 2 tables, and 2 Soviet references.

TITLE:

Set of methods for evaluating the effects of additives on the
operating properties of motor oils

PERIODICAL:

Referativnyy zhurnal. Khimiya, no. 5, 1962, 528-529,
abstract 5M216 (3b. "Prisadki k maslam i toplivam".
M., Gostoptekhizdat, 1961, 254-263)

TEXT: It is proposed that the operating properties of motor oils
containing additives be evaluated by a series of laboratory methods
consisting of 3 groups: (1) micromethods (total consumption of oil, 10 ml),
(2) tests on ИЗБ (PZV) and ИЗЗ (PZZ) apparatus (total consumption of oil,
0.5 l) and (3) tests on the ИТ9-5 (IT9-5) and ИТ9-3 (IT9-3) single
cylinder engines (total consumption of oil, 2.5 l). The first group
covers determination of: thermooxidizing stability and coefficient of
lacquer formation ИОСТ4953-49 (GOST 4953-49) and ИОСТ9352-60 (GOST 9352-
-60)), motor volatility, active fraction and tendency to form lacquer

Set of methods ...

(ГОСТ 5737-53 (GOST 5737-53)), thin-layer evaporation of the oil
(ГОСТ 8674-58 (GOST 8674-58)), critical lacquer formation temperature
(method described) and the scale-forming properties by evaporating 0.2 g
of oil in an aluminum cup at 400°C until a carbon residue is formed
(method described). On the PZV apparatus, they evaluate the washing
properties of the oil according to ГОСТ 5726-52 (GOST 5726-52) and the
emulsifying properties (method described). In the test on the PZZ
apparatus the oil is mixed with air and circulated at 150°C through a cell
with lead and copper plates, and after 2 hrs circulation the corrosion of
the lead plates is determined, the sediment in the oil on diluting with
isooctane and the evaporation of the oil during the test (method described).
On the IT9-5 engine primary motor tests are carried out by the НИИ ГСМ-20
method for 20 hrs, evaluating the formation of lacquer on the piston and
the corrosion properties of the oil from the loss in weight of the lead
plates in the cell through which the working oil circulates. On the IT9-3
engine the scale-forming capacity of the oil is evaluated by the PZI
(method described), by which the quantity of scale on aluminum surfaces

TITLE: A new method for evaluating the detergent effectiveness of additives
PERIODICAL: Khimiya i tekhnologiya topliv i masel, no.8, 1962, 66-70

TEXT: The reserve of detergent potential of lubricating oils was evaluated by the proportion of a standard deposit-forming substance which the oils can contain without formation of large insoluble aggregates. The tests were conducted in a cylindrical steel vessel, 50 mm high, 27 mm in diameter, covered with a metal cap with a central hole 1 mm in diameter. The cylinder is filled with 5 m³ of oil and heated at 250 °C for 30 min. The oil is then dissolved in 45 m³ of benzine and filtered through a filter "ШОТТА" ("Shotta") no.4. Increasing amounts of 5% solution in mineral oil of the standard contaminant Б-353 (B-353) (ester of dialkylphenoldithiophosphoric acid) are added to the investigated oil and the maximum proportion of the contaminant found at which the filter is not coloured or only

Card 1/2

A new method for evaluating the ...

S/065/62/000/008/003/003

slightly coloured. The detergent potential is given by

$$\frac{\vartheta}{100 - \vartheta} \times 10$$

where ϑ is the maximum quantity of the standard contaminant in percent weight added to the oil under investigation. To ensure that a given detergent oil performs satisfactorily in thermally stressed engines it should have a high thermooxydation stability (above 80), good detergent properties as determined by ПЗВ (PZV) apparatus (0), and high detergent potential (above 60). There are 3 figures and 3 tables.
